ABSTRACTED-PUB-NO: FR 2688689A

BASIC-ABSTRACT:

The fixing consists of a screw (1), threaded along the whole length of its shank, which is screwed inside a tubular artificial ligament to lock it against the wall of a channel through the bone. The screw shank is cylindrical in shape with a conical trip, and the surface of its thread is non-triangular in section, being e.g. square, trapezoid or rounded.

The head of the screw has a hexagonal recess to take a key. The screw thread pitch can be, for example. 2.25 mm, and the threads can project some 0.6 mm above a 4 mm diameter shank.

ADVANTAGE - Prevents ligament from being sheared by screw thread as it is fixed in place.
